Jackson Lanyon

Software Engineer - Brisbane, Australia

linkedin.com/in/jdlanyon - github.com/JDLanyon - jdlanyon.dev

jlany9@hotmail.com

Technical Skills

Languages: TypeScript / JavaScript, Python, C#, Java, HTML / CSS, SQL, Shell

Frameworks & Libraries: React, Next.js, Vue 3, Vite, VitePress, Node.js, JavaFX, .NET

Data & APIs: REST API integration, MySQL, SQLite, Pandas / NumPy, data pipelines

Tools & Platforms: Git (GitHub & Forgejo), Docker, Linux (Arch / Debian), systemd, nginx, Cloudflare, GitHub Actions (CI/CD)

Practices: Agile & Scrum, Git branching workflows, automated testing, responsive and accessible UI

Work Experience

AQSeptence Group

Software Engineer *2021 - Geebung, QLD*

- Engineered data-processing tools in **Python (Pandas, NumPy), PowerShell and VBA**, automating CSV parsing, Excel reformatting and data sorting to remove manual handling and improve workflow efficiency.
- Recovered and migrated critical legacy data from **Lotus Notes** databases, preserving business continuity and data integrity during a system transition.
- Designed a scheduled **information aggregator and backup system** in Python that ran automatically every Friday at midnight, eliminating manual intervention and reducing the risk of data loss.
- Developed nested sorting algorithms for **compound part lists in Excel files**, enabling hierarchy visualisation and improving inventory management.

QUT - Business Process Improvement Office

Software Testing Engineer *2020 - Kelvin Grove, QLD*

- Implemented automated testing frameworks using **Katalon and Selenium with Java**, reducing regression test execution time and accelerating sprint delivery cycles.
- Transitioned legacy test scripts from Katalon's `.groovy` files to **Selenium-based Java tests** with two other engineers, avoiding a complete rewrite and improving long-term test maintainability.
- Collaborated within an Agile team using **Git, Jira and Microsoft Teams**, helping ensure secure releases for staff and students through daily stand-ups and sprint reviews.

Production Web Development

Ongoing independent engineering, self-directed alongside full-time study. All of the below is publicly verifiable on GitHub and deployed live.

sausytime.com - Designer Portfolio

Full-Stack Developer (solo) *Next.js, TypeScript, React, Cloudflare Pages, GitHub Actions (2025 - 2026)*

- Independently designed, built and shipped a **production website** in Next.js and TypeScript, now deployed to Cloudflare Pages through an automated GitHub Actions workflow.
- Built a markdown-driven content pipeline with dynamic project routing and modals, and documented the architecture in GitHub issues to plan the roadmap.
- Engineered responsive, accessible UI with CSS animations, dynamic theming and dark / light mode, and later migrated the app from self-managed hosting to Cloudflare Pages.

jdlanyon.dev - Programmer Portfolio

Full-Stack Developer (solo) *VitePress, Vue 3, TypeScript, GitHub Actions (2026)*

- Built a production portfolio as a **VitePress + Vue 3 + TypeScript** static site, with custom components for project cards, modals and a markdown-driven blog.
- Automated the build with a **GitHub Actions CI/CD pipeline** that pulls project content from GitHub at build time, replacing manual content updates.
- Implemented a seeded pseudo-random animation system in Vue so server-rendered and client-rendered frames stay in sync, avoiding hydration mismatch.

Projects

Task Tank

Gamified Task and Pomodoro Manager *Java, JavaFX, SQLite (2025)*

- Collaboratively designed and built a **full-stack desktop application** combining gamified task tracking with a Pomodoro timer.
- Architected a modular MVC structure with separate controller, model and view layers, so teammates could add features independently without merge conflicts or refactoring shared logic.
- Implemented local persistence via SQLite, caching frequently accessed task data to reduce startup time.

BeeAware Capstone

Cross-Team Database Plugin *C#, SQL, HTML, CSS, JavaScript (2023)*

- Worked across two cross-functional capstone teams (five members total) to build a **browser plugin** integrating with a beekeeping project's MySQL database, closing a data visibility gap for end users.
- Designed SQL queries using indexed lookups and parameterised statements to securely fetch beehive telemetry data.
- Delivered all milestones on schedule across a **12-week development cycle** with weekly cross-team stand-ups and Git-based code reviews.

Education

Bachelor of Games & Interactive Environments - Software Technologies Major

Queensland University of Technology (QUT)

Software Technologies major, Advanced Software Technologies minor, Graphic Design minor

Relevant coursework: Algorithms and Complexity, Systems Design, High Performance Computing, Game Engine Theory, AI for Games, Immersive Environments, Visual Communication, Capstone Project
